## R Courses

1. Introduction to R  
(Week 1)
2. Data manipulation and  
joining data with dplyr  
(Week 2&3)
3. Data visualization with  
ggplot (Week 4&5)
4. Project (Weeks 6 to 10)

# Project Questions

**“What if” we change our  
E. Coli standard?**

**What is the contribution  
of point sources and non-  
point sources for  
impaired waters?**

**Which states use  
narratives to list  
impairments?**

**What is the average  
annual air quality for  
PM10, PM2.5, O3, SO2?**

# Arizona's Index of Biological Integrity

## Macroinvertebrates

Matt Robinson  
[robinson.matt@azdeq.gov](mailto:robinson.matt@azdeq.gov)

# Macroinvertebrate Data

- 2,084 samples collected between 1993-2023
- 557 sample sites
- 1,215,464 individuals
  - 896 unique taxa
    - 32 Orders
    - 143 Families
    - 512 Genera

# Index of Biological Integrity (IBI)

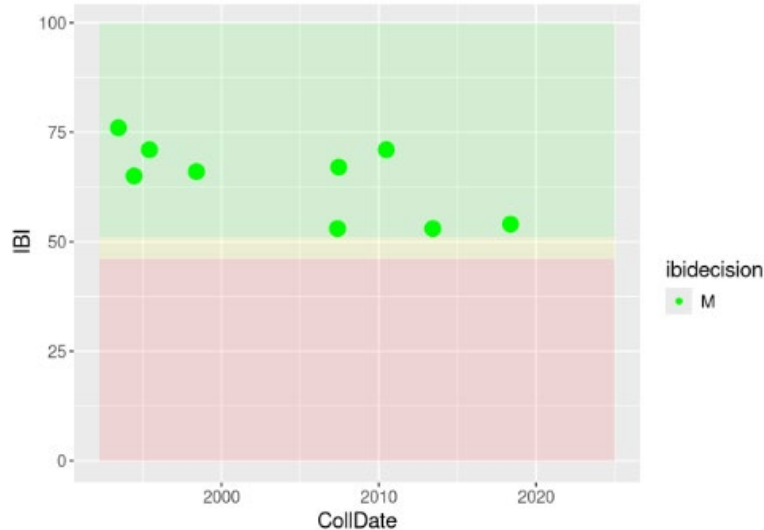

- Requirements: Wadeable, perennial, riffle/run habitat, sampled during the index period
- Cold Vs Warm water
  - Cold water IBI: 7 metrics
  - Warm water IBI: 9 metrics

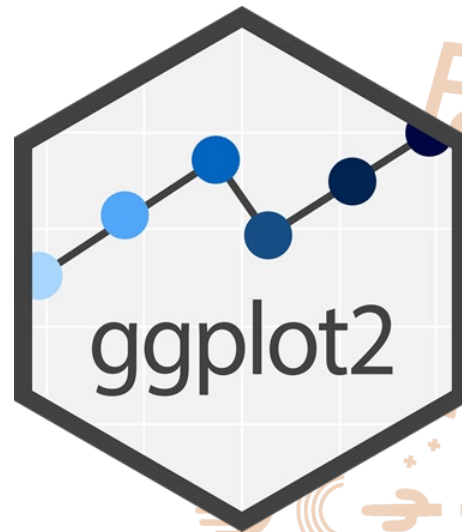

```
315 ▾ ##### 2 - Number of Ephemeroptera Taxa ----  
316 m.w.ephtaxa <- mats %>%  
317   filter(is.na(exclude)) %>%  
318   filter(Order == "Ephemeroptera") %>%  
319   group_by(StationID, CollDate, RepNum) %>%  
320   summarize(NumEphTaxa = n()) %>%  
321   select(StationID, CollDate, RepNum, NumEphTaxa) %>%  
322   mutate(M.NumEphTaxa = ifelse(NumEphTaxa >= R.W.NumEphTaxa, 100,  
323                                (NumEphTaxa/R.W.NumEphTaxa)* 100))
```

# IBI Assessment and Visualization

- Determine if IBI scores are meeting or violating standards
- Plot all IBI scores for a Waterbody

```
38 ## 3.1.1 - Exceedances ----
39 # Determine if samples are meeting the standard
40 ibi.warm <- ibi_agg %>%
41   filter(InvertReg == "Warm") %>%
42   group_by(WBID) %>%
43   mutate(count = n()) %>%
44   mutate(ibidecision = ifelse(IBI < 40, "V",
45                               ifelse(IBI >= 40 & IBI <= 49, "I", "M")))
```

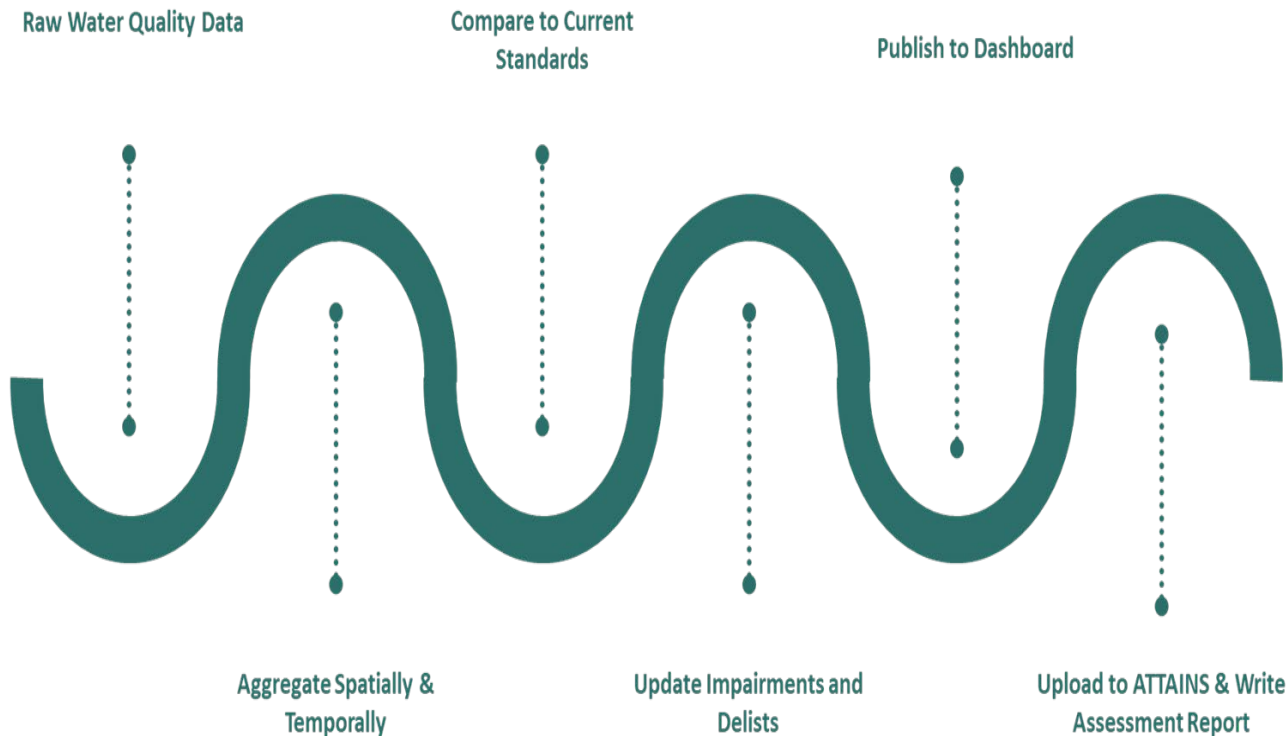

# Arizona's Automated Assessment

Mackenzie Moore

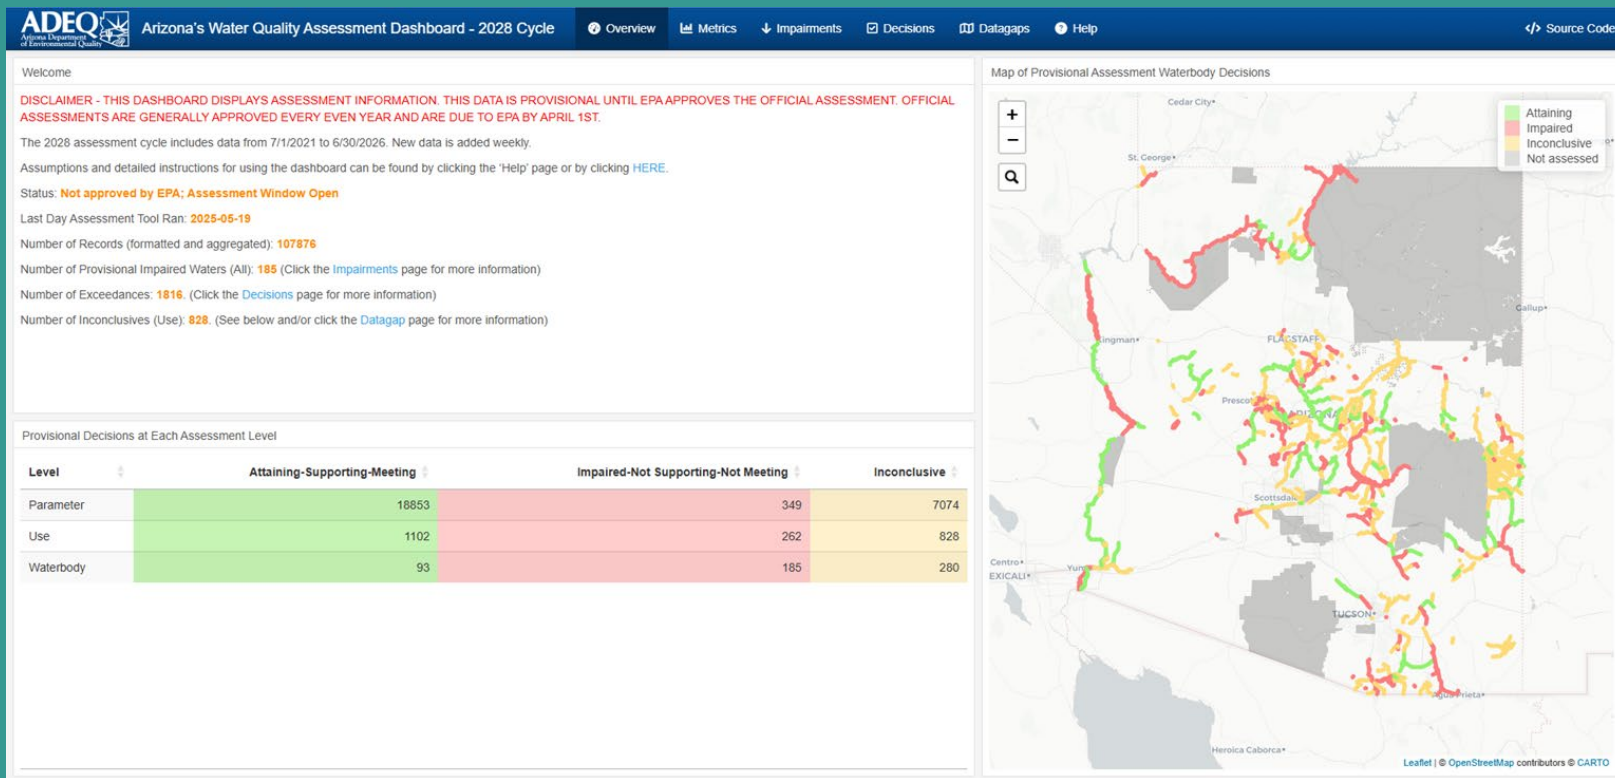

[moore.mackenzie@azdeq.gov](mailto:moore.mackenzie@azdeq.gov)

# The Assessment Calculator

- Pulls data from the WQP using dataRetrieval
- Converts data to common schema
- Determines exceedances
- Assesses waterbodies
- Outputs decisions on Shiny dashboard and in files for ATTAINS

# Assessment Dashboard

[https://azdeq.shinyapps.io/assessment\\_dashboard\\_2028\\_Prod/#section-dashboard](https://azdeq.shinyapps.io/assessment_dashboard_2028_Prod/#section-dashboard)

# Using R to Streamline TMDL Processes

Zac White, *Environmental Scientist*  
[white.zac@azdeq.gov](mailto:white.zac@azdeq.gov)

# ADEQ's TMDL Unit R Processes

- Data management & analysis
  - Find, clean, graph, analyze
  - Ex: Pull data from the Water Quality Portal
- Modeling
  - Analyze trends
  - Seasonality and flow variation
  - Ex: Load Duration Curve template
- Shiny and Flexdashboard apps
  - Create customizable apps in R
  - Ex: ADEQ's live apps

*The Salt River above Roosevelt Lake*

# Data Management - Pulling Data from the Water Quality Portal

## Preparing Water Quality Data for Analysis

1. Load dataRetrieval package
2. Pull WQP data using dataRetrieval package script
  - a. Waterbody(ies)
  - b. Pollutant(s)/Parameter(s)
  - c. Sample time period
3. Clean/QC/Graph/Analyze Results
  - a. Remove duplicates & erroneous data
  - b. Standardize units
  - c. Graph trends
  - d. Statistical analysis

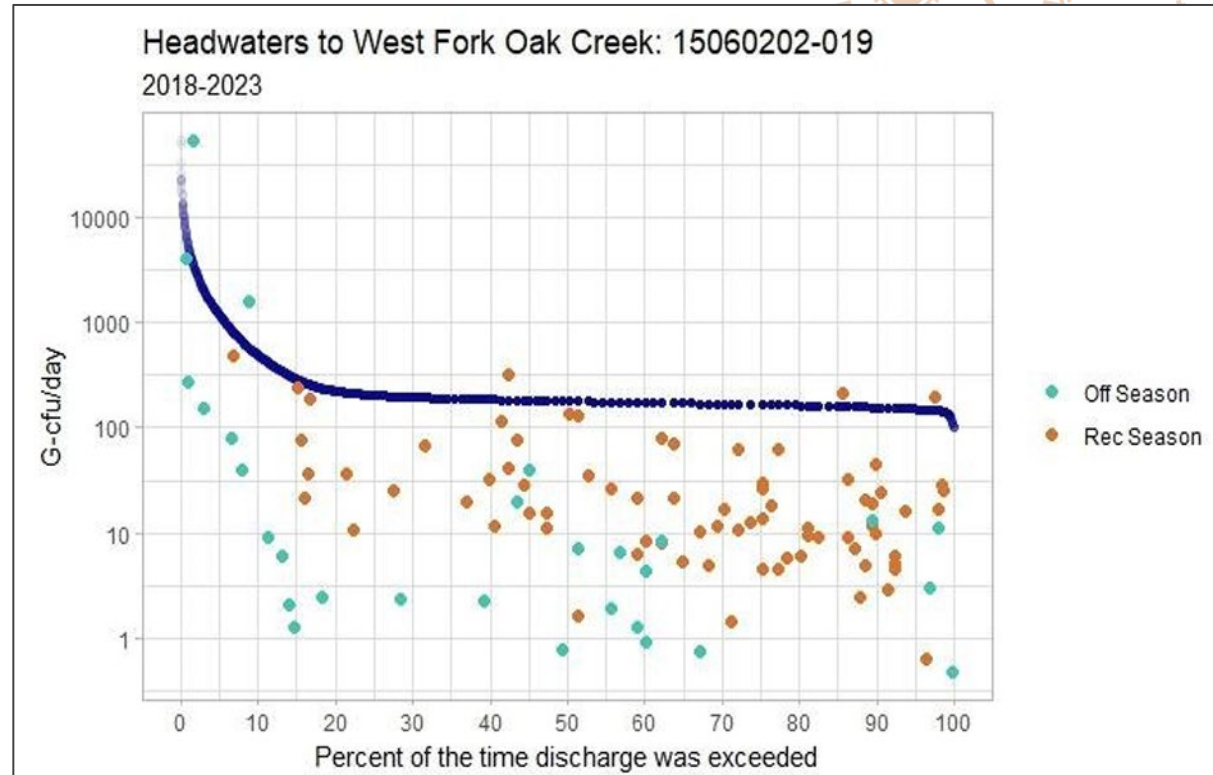

# R Modeling - Load Duration Curves (LDCs)

## Uses for LDCs:

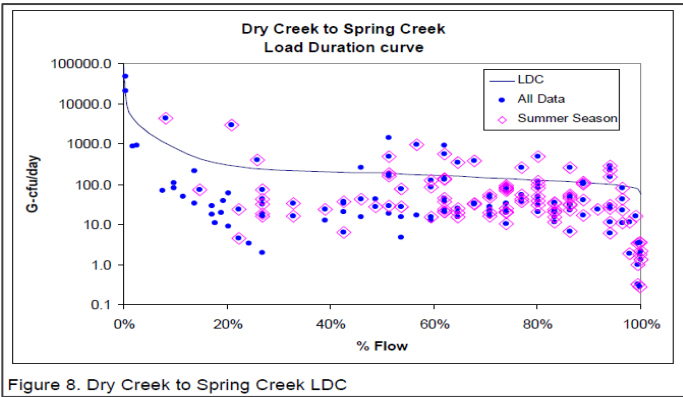

- Critical conditions
- Pollutant load reductions

## Requirements:

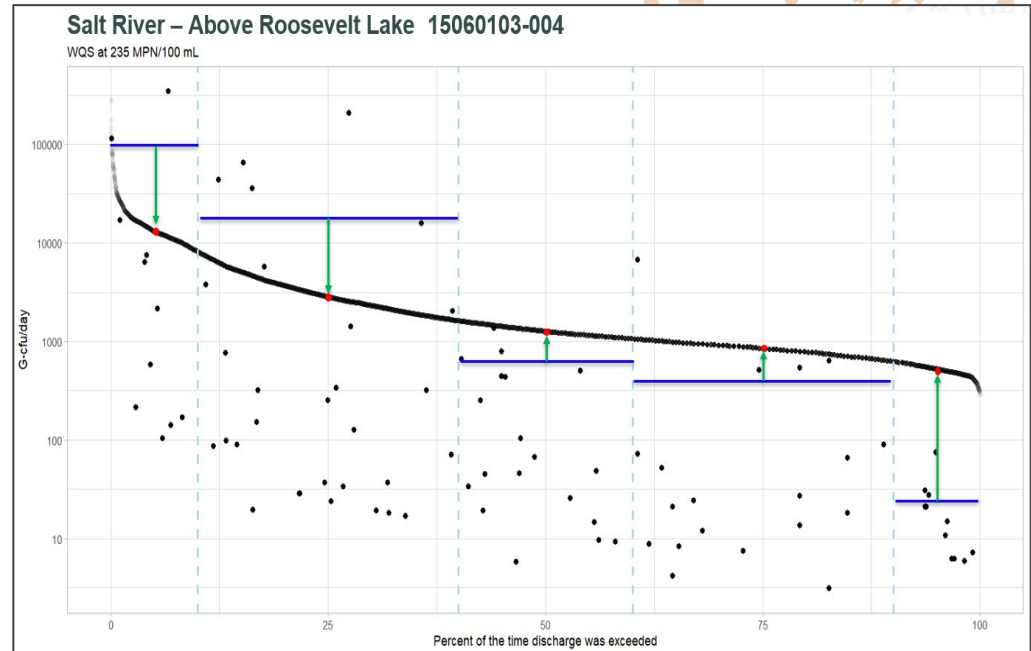

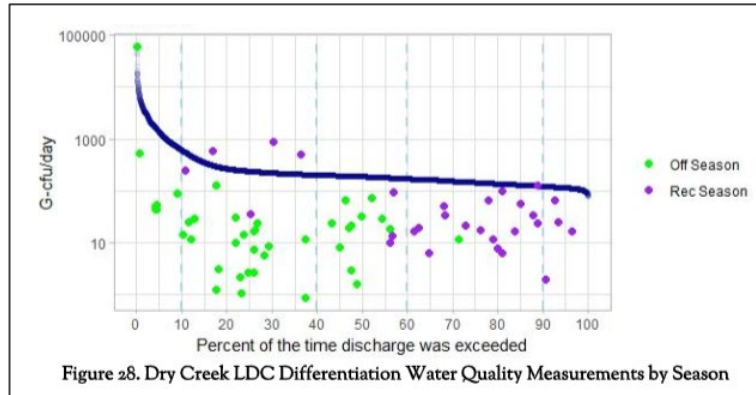

- LDC template on Github
- Water quality data
- Flow/discharge data
- Tidyverse package
  - Statistical analysis
- Ggplot2 package
  - Graph results

# Customizing Load Duration Curves

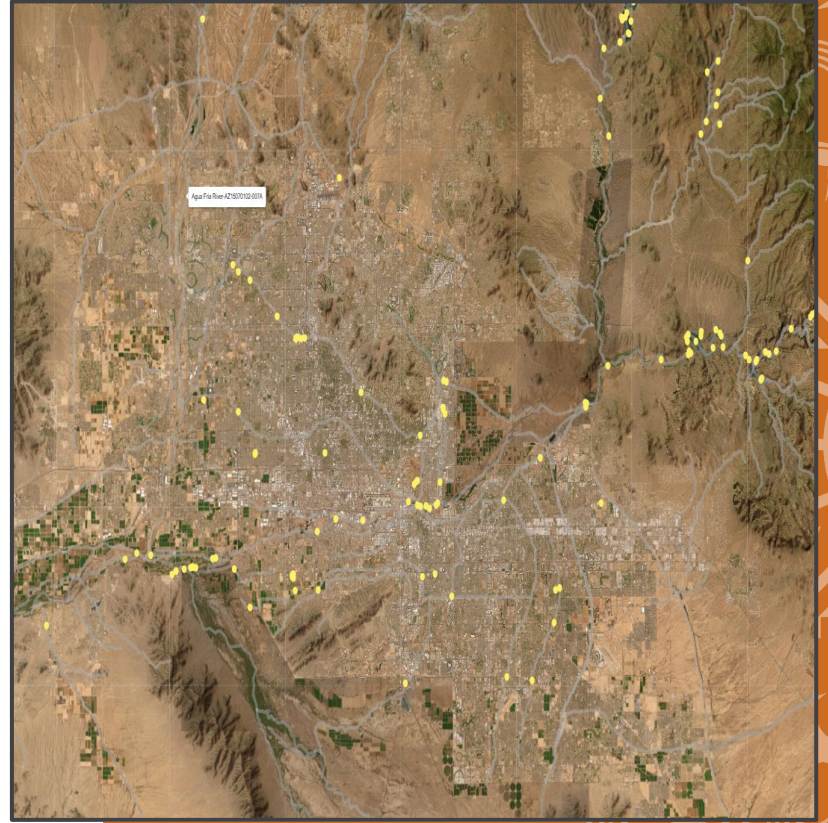

ggplot2 customization allows for  
LDCs tailored for each project

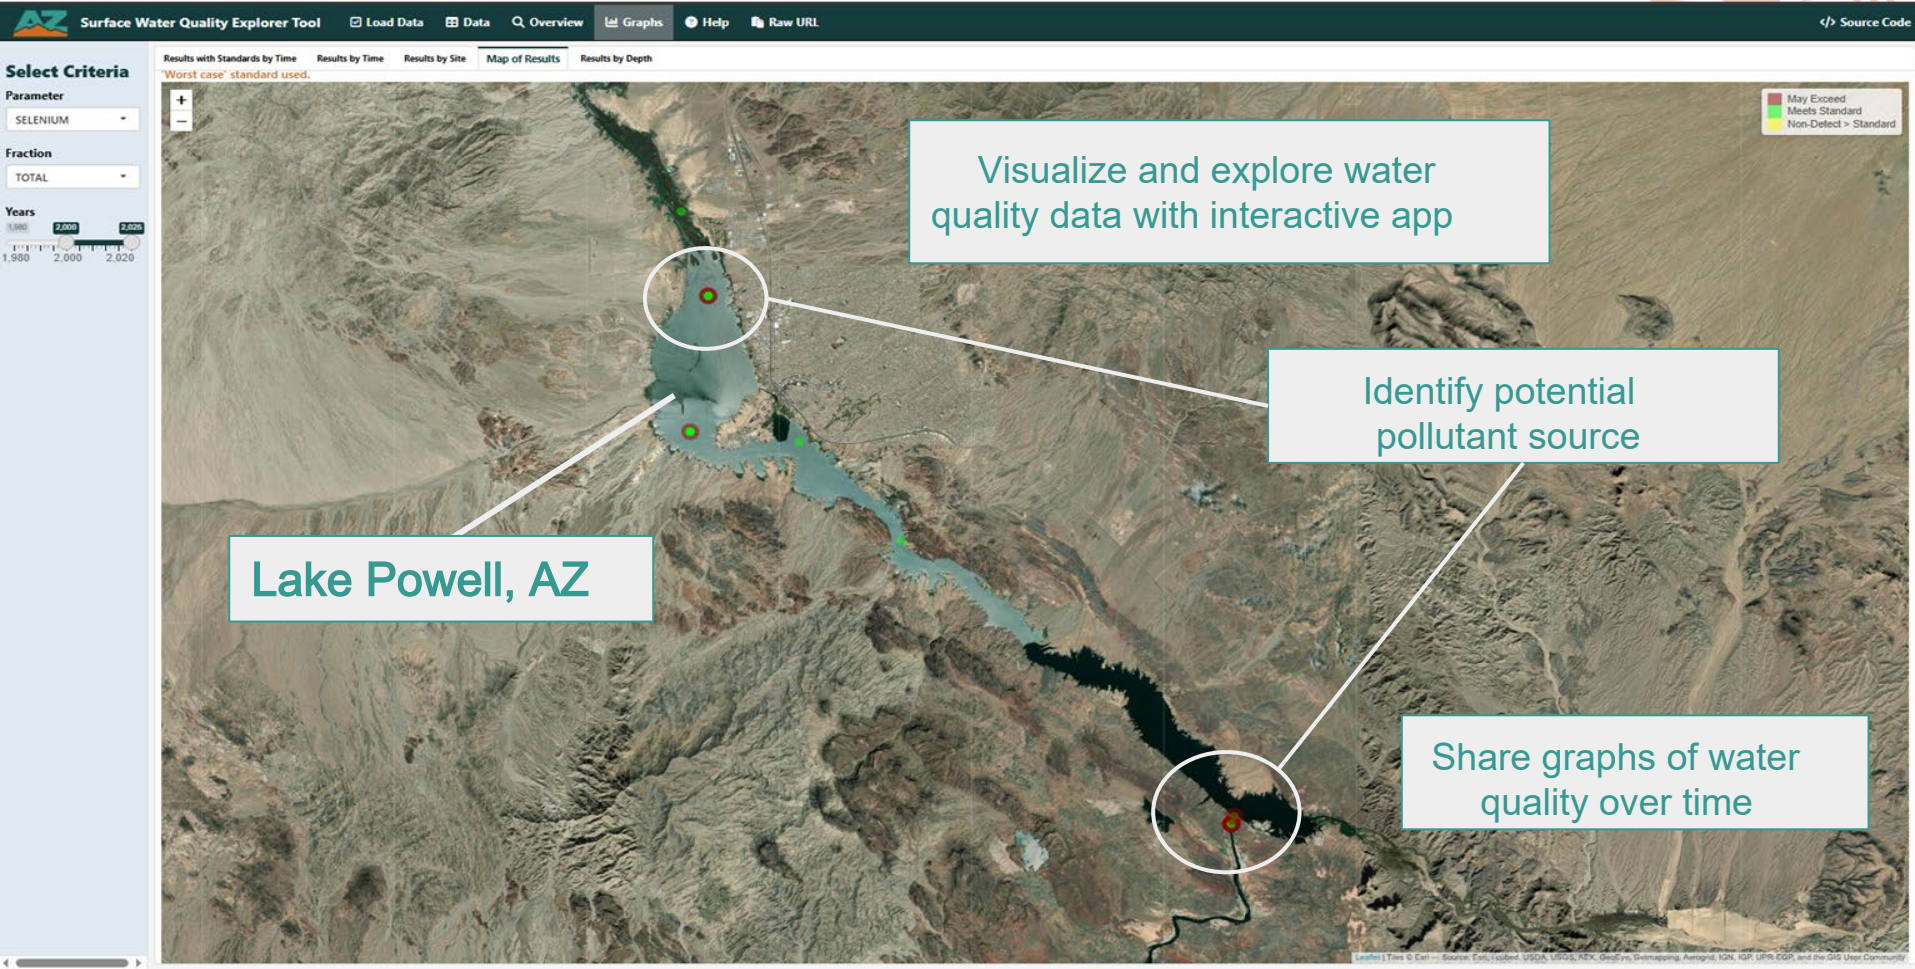

# Building Apps to Address Challenges

## R applications in TMDL processes?

- Identify data gaps
- Share datasets
- Impaired water prioritization
- Inform stakeholders, partner orgs

# Surface Water Quality Explorer Tool

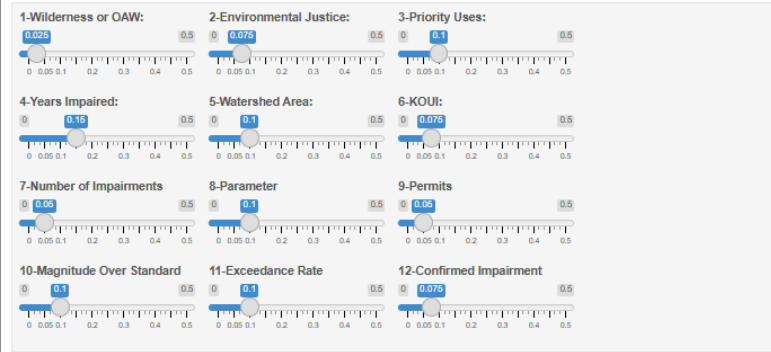

# Arizona's TMDL Priority Application

Developed by: Jason Jones

Overview Metrics & Sources **Assign Weights** Index

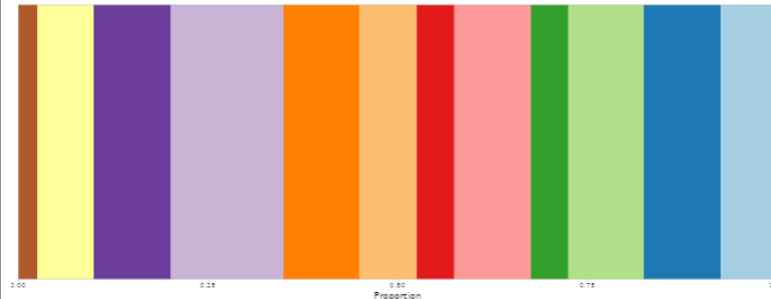

Weights determine how much influence each metric has when creating the index. Default values have been chosen but these can be adjusted by moving individual sliders. Overall weights should equal 1. Weights should be assigned based on agency priority. Human judgement is needed to pick what is important. The application is used to help make the calculations fast and transparent but does not decide what is important for the user (although defaults are suggested).

Weight must equal a total of 1

Distribution of Weights

# TMDL Prioritization App

Index of AZ's high priority waters based on state statutes, risk factors, agency metrics

## Index Results

See the [Download Index - Raw Results](#) to see the math behind how the index was calculated.
